AttainInsight
Security 4X

Background

Attain Insight's Security 4X (S4X) was built to solve the problems of end user authorization, large scale security migrations, and compliance audit reporting for medium and large organizations. S4X connects to all the industry-leading directory server environments.
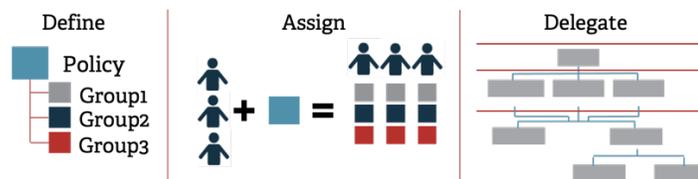

AttainInsight
Security 4X

Supported Environments:

Active Directory   Apache Directory   Google Cloud Identity   HCL Domino   IBM Cognos Analytics   NetIQ eDirectory   okta

Overview
End User Authorization

S4X streamlines the end user authorization process by introducing the ability for IT to define security policies, assign users to these policies, and delegate about 50% of all authorizations to business users in a controlled fashion. These features lead to a 90% productivity improvement on day one.

Security Migration

With S4X, administrators can have the confidence to plan, model, and test mass security changes before implementing a large-scale change. Administrators can carry out many types of tasks that are virtually impossible without a tool. They can: establish a baseline of current security settings; completely wipe away, rebuild, and migrate security from one geography, platform, and/or tier to another; and maintain complete audit records.

Audit Reporting

S4X captures all security change events as they occur in real-time. It provides both current and historical views across entire environments that can be worldwide in scope and tracks security changes through its audit reporting. Maintaining corporate audit standards is greatly simplified because audit records are instantly captured with every change.
